

What makes the Spinfire Pro 2 (v2) better than the original v1?

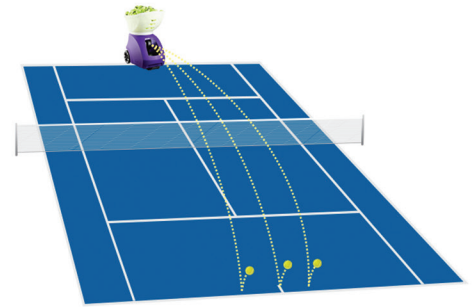

Improved ball variation:

The 'Horizontal Oscillation' function has been replaced with 'Horizontal Random', so it randomly selects spots across the court rather than sweeping from side to side.

The 'Vertical Oscillation' function has been replaced with 'Vertical Random', so it randomly selects the longest or shortest points rather than sweeping up and down.

'Horizontal Random' now includes a 'narrow' option, rather than just 'wide' or 'medium'.

Improved portability and practicality:

New improved shape decreasing the overall size.

Larger transport wheels with a full axle through the body for extra stability and support.

The charging port has been designed to allow charging while the hopper is inverted whereas previously this was not possible.

Added a pocket for the remote control.

Added an extra handle at the top of the mouth for carrying the machine when the hopper is inverted.

Improved carousel design to ensure all balls are fired.

Reduced mouth size decreases the chances of returned balls entering the machine.

The master switch has been moved to the control panel for easier access.

The LCD display has been recessed into the control panel for a flush finish and better visibility.

Improved reliability and durability:

Improved motherboard design with simple colour coded connectors.

The Internal curtain is now made from recycled plastic.

Simplified cable routing and battery brace for a better internal design.
